Abstract
This research was supported by the Excellence Initiative of the Alexander University of Alexandria, Egypt. Topographical and geological maps were provided by the Egyptian Survey Authority and the Geological Survey and Mining Authority of Egypt. Special thanks to the editors of the Méditerranée journal and to the anonymous reviewers.

1. Introduction
Bani Salama lies in a region part of an Wadi of Wadi Abbasiyah. The site contains many of its ancient cities as well as the Tell Abu Sefah, 1980). Bani Salama is located in the Wadi El-Tumeilat, which is the eastern part of the Nile Delta, Egypt. The Wadi El-Tumeilat is a natural corridor between the Nile Delta and the Sinai Peninsula and the Levant. It is bounded to the north by Lake Manzala and to the south by the Ismailia Canal. The Wadi El-Tumeilat is a region of about 1500 km² in the east, and 200 m in the north. The eastern part of the Wadi El-Tumeilat is a region of about 1500 km² in the east, and 200 m in the north. The eastern part of the Wadi El-Tumeilat is a region of about 1500 km² in the east, and 200 m in the north.

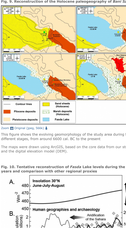
Fig. 9. Reconstruction of the Holocene palaeogeography of the study area.

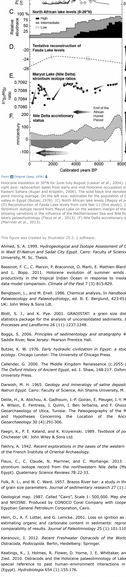


Inset: (1) Original Cyprus, 1950; (2) Modern Cyprus, 1950.

This figure shows the evolving palaeogeography of the study area during four different stages, from around 6000 cal. BC to the present day.

The maps were drawn using ArcGIS, based on the data from our study, maps and the digital elevation model (DEM).

Fig. 10. Reconstruction of Fauske Lake levels during the past 8000 years and comparison with other regional proxies



Inset: (1) Insolation curve, 1976; (2) Human geographical archaeological curve, 2000; (3) North African lake levels (9-28°N), 2007; (4) Tentative reconstruction of Fauske Lake levels during the past 8000 years and comparison with other regional proxies, 2013.

Holocene insolation at 30°N for June-July-August (Laskar et al., 2004). (2) On the human geographical archaeological curve, the Neolithic period is shown in red, the Eastern Sahara (Kuper and Kröpelin, 2006). The solid black line denotes a three-point moving average. On the left axis: estimates for the population of the Nile Valley (Hassan, 1997). (3) North African lake levels (9-28°N) (Gasse, 2000; Gasse, 2002). (4) Reconstruction of Fauske Lake levels over the past 8000 years (this study). (5) Strontium isotope record from Nayul Lake on the eastern margin of the Nile Delta: accretionary outbreak phases (Marriner et al., 2012). (6) Nile Delta accretionary outbreak phases (Stanley et al., 2003). (7) Nile Delta accretionary outbreak phases (Marriner et al., 2012).

This figure was created by Illustrator 25.3.1 software.

File: image/png, 609k

Title: **Fig. 2. Natural context of *Beni Salama***

Caption: This figure shows the geological, geomorphological and hydrological characteristics of the study area. It was drawn using a ClassScript map in ArcGIS, based on the Conoco Coral Company geological map (CONOCO Coral Company, 1987). The digital elevation model (DEM) has a spatial resolution of 30 m and was produced using data from the Shuttle Radar Topography Mission (SRTM). The boreholes were drawn, and the contour lines were extracted from the DEM using ArcGIS 10.2.

Title: **Fig. 4.**

Caption: The ancient desert route connecting Wadi El-Natrun depression with El-Tarrana city

Credits: This figure was drawn using the topographic map of Wadi El-Natrun depression produced in 1926 by the Egyptian Survey Authority (Scale 1:100000, Sheet: 84/54). The ancient desert route connecting Wadi El-Natrun depression with El-Tarrana city was digitized in ArcGIS 10.2. This ancient desert route was used by the Romans, and the ancient city of El-Tarrana point served as a point of export for raw glass from Wadi El-Natrun during the Roman period.
